# SKF – the knowledge engineering company

From one simple but inspired solution to a misalignment problem in a textile mill in Sweden, and fifteen employees in 1907, SKF has grown to become a global industrial knowledge leader.

Over the years, we have built on our expertise in bearings, extending it to seals, mechatronics, services and lubrication systems. Our knowledge network includes 46 000 employees, 15 000 distributor partners, offices in more than 130 countries, and a growing number of SKF Solution Factory sites around the world.

## Research and development

We have hands-on experience in over forty industries based on our employees' knowledge of real life conditions. In addition, our world-leading experts and university partners pioneer advanced theoretical research and development in areas including tribology, condition monitoring, asset management and bearing life theory. Our ongoing commitment to research and development helps us keep our customers at the forefront of their industries.

## Meeting the toughest challenges

Our network of knowledge and experience, along with our understanding of how our core technologies can be combined, helps us create innovative solutions that meet the toughest of challenges. We work closely with our customers throughout the asset life cycle, helping them to profitably and responsibly grow their businesses.

## Working for a sustainable future

Since 2005, SKF has worked to reduce the negative environmental impact from our operations and those of our suppliers. Our continuing technology development resulted in the introduction of the SKF BeyondZero portfolio of products and services which improve efficiency and reduce energy losses, as well as enable new technologies harnessing wind, solar and ocean power. This combined approach helps reduce the environmental impact both in our operations and our customers' operations.

*SKF Solution Factory makes SKF knowledge and manufacturing expertise available locally to provide unique solutions and services to our customers.*

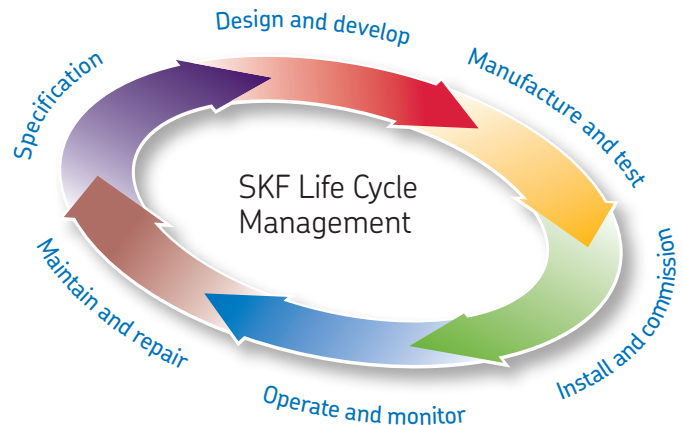

*Working with SKF IT and logistics systems and application experts, SKF Authorized Distributors deliver a valuable mix of product and application knowledge to customers worldwide.*

## Our knowledge – your success

**SKF Life Cycle Management is how we combine our technology platforms and advanced services, and apply them at each stage of the asset life cycle, to help our customers to be more successful, sustainable and profitable.**

### Working closely with you

Our objective is to help our customers improve productivity, minimize maintenance, achieve higher energy and resource efficiency, and optimize designs for long service life and reliability.

### Bearings

SKF is the world leader in the design, development and manufacture of high performance rolling bearings, plain bearings, bearing units and housings.

### Innovative solutions

Whether the application is linear or rotary or a combination, SKF engineers can work with you at each stage of the asset life cycle to improve machine performance by looking at the entire application. This approach doesn't just focus on individual components like bearings or seals. It looks at the whole application to see how each component interacts with each other.

### Machinery maintenance

Condition monitoring technologies and maintenance services from SKF can help minimize unplanned downtime, improve operational efficiency and reduce maintenance costs.

### Design optimization and verification

SKF can work with you to optimize current or new designs with proprietary 3-D modelling software that can also be used as a virtual test rig to confirm the integrity of the design.

### Sealing solutions

SKF offers standard seals and custom engineered sealing solutions to increase uptime, improve machine reliability, reduce friction and power losses, and extend lubricant life.

### Mechatronics

SKF fly-by-wire systems for aircraft and drive-by-wire systems for off-road, agricultural and forklift applications replace heavy, grease or oil consuming mechanical and hydraulic systems.

### Lubrication solutions

From specialized lubricants to state-of-the-art lubrication systems and lubrication management services, lubrication solutions from SKF can help to reduce lubrication related downtime and lubricant consumption.

### Actuation and motion control

With a wide assortment of products – from actuators and ball screws to profile rail guides – SKF can work with you to solve your most pressing linear system challenges.

# The SKF factory pre-lubrication standard

SKF now offers pre-lubricated linear bearings as a standard greased at the factory. The pre-lubricated bearings will save assembly time by eliminating the need to grease the bearings. Due to factory calibrated grease fill, the reliability of the bearing will be improved. Using pre-lubricated bearings will reduce maintenance costs as well.

SKF linear ball bearings and units for shaft diameter 6 mm and greater are factory pre-lubricated<sup>1)</sup> by default<sup>2)</sup>. Due to the integrated grease reservoir and the use of SKF double-lip seals (2LS), most applications will not require relubrication because the theoretical relubrication interval exceeds the bearing life.

The linear bearings are lubricated with the high-performance SKF grease LGEP2.

Our technical support as well as the technical handbook for linear bearings and units (order number 6402 EN or download at [www.linear-motion.skf.com](http://www.linear-motion.skf.com)) are available for further questions on the factory pre-lubrication.

## Sealing

The double-lip seal ensures maintenance-free life for pre-lubricated bearings that operate under standard conditions. The integral seal has been designed specifically for linear bearings. The seal lips maintain full contact with the shaft while offering a superior sealing solution even when used with the shaft for the self-aligning linear bearings of the LBC series. The seals have also been optimized for low friction operation.

## Lubricant

LGEP2 is an extreme pressure bearing grease from SKF for a wide range of industrial and automotive applications. Based on a lithium soap/mineral oil, the additives provide a good corrosion resistance and anti-wear protection. Special greases for food, clean room or high temperature environments are available upon request.

The double-lip sealing

<sup>1)</sup> as from July 2007

<sup>2)</sup> linear ball bearings without factory pre-lubrication and preservative only can be ordered by using the suffix "/VT808", e.g. LBCR 20 A-2LS/VT808

# Product overview - Linear bearings and units - Standard range

This catalogue covers SKF linear ball bearings, linear plain bearings and accessories that can be used to construct economic and simple linear guidance systems for a wide variety of applications. In cases where, for example, load conditions are such that these bearings and units cannot be used, other SKF linear guidance products and systems are available. For additional information regarding these other products and systems, contact your local SKF representative.

This publication includes series 1 and 3 linear ball bearings, manufactured to ISO 10285 and linear plain bearings with the same dimensions.

## Series 1 linear ball bearings and units

Linear ball bearings (LBBR) in series 1 are compact and easy to mount. These bearings with or without seals are available in a standard version as well as a corrosion resistant version. Linear ball bearing units in this series, which include a bearing and housing, are available as single, or tandem units. Tandem units include duo and quadro versions.

## Series 3 linear ball bearings and units

Series 3 linear ball bearings include the advanced cylindrical LBCR and LBCT design, the self-aligning LBCD and LBCF design and the LBHT design with extra high load carrying capacity. Any of the bearings in the ISO series 3 are available in a standard and corrosion resistant version,

with an integral double lip seal to provide maintenance-free operation under normal conditions. These linear ball bearings are interchangeable with all former SKF series 3 bearings.

Most series 3 linear bearing units are fitted as standard with self-aligning linear ball bearings to accommodate misalignment. Other designs are also available and can be found in the appropriate tables.

## Series 3 linear plain bearings and units

LPAR and LPAT linear plain bearings are included in the series 3 size range.

**NOTE: SKF linear ball bearings are coated with a corrosion inhibiting preservative. Before mounting non pre-greased linear bearings should be suitably lubricated.**

# Linear ball bearings, ISO series 1

## LBBR linear ball bearings

The LBBR is a patented SKF linear ball bearing that combines a plastic cage with hardened steel raceway segments to guide the ball sets. The bearing conforms to dimension series 1 according to ISO 10285.

The LBBR raceway segments have been designed to fully utilize the entire length of the load zone to increase bearing capacity and extend bearing service life.

The plastic cage has been redesigned to provide optimum performance. All ball recirculations are designed to offer no resistance to the cage on the running-in and runout

of the recirculation. The redesigned cage also accommodates larger balls to provide increased load capacity and service life.

The sealed variant is fitted with integral double lip seals. These seals have an inner lip to keep lubricant in the bearing; the outer lip acts like a wiper seal to keep contaminants out of the bearing.

Unsealed bearings are fitted with non-contacting shields to protect the bearing from large contaminant particles. LBBR linear ball bearings do not need to be secured axially in the housing provided the housing bore is sized correctly.

## Stainless steel variant

LBBR linear ball bearings are also available with stainless steel balls and raceways for wet or corrosive environments. The stainless steel variant is identified by a HV6 suffix in the designation, e.g. LBBR 16-2LS/HV6. When used in combination with SKF stainless steel shafts, it is possible to create a guidance system made entirely of stainless steel.

<sup>2)</sup> not factory pre-lubricated

# Linear plain bearings, ISO series 1

LPBR linear plain bearings, which have the same dimensions as LBBR linear ball bearings, are made out of PAS-LX (Copolymeres Polyoxymethylen) with a special polyethylene to provide smooth, stick-slip-free operation. These linear plain bearings are self lubricating under normal conditions and require minimal maintenance. They have a high static load carrying capacity and are resistant to shock loads.

SKF recommends a light coating of lubricant during installation to improve the performance during the running-in period even if the bearings are to be used "lubricant-free".

LPBR linear plain bearings are intended for applications where there are heavy shock loads and/or vibrations or high accelerations and speeds when the bearing is unloaded. Under these operating conditions linear plain bearings provide longer service life than linear ball bearings. However, increased friction must be expected.

# Linear bearing units, ISO series 1

**Linear bearing units** incorporating closed ISO series 1 bearings are available for applications where the shaft is only supported at each end. These cost-effective bearing units are extremely compact and can accommodate loads exceeding 25 000 N (e.g. LQBR 50-2LS; see also page 17).

The maximum permissible angular misalignment is 15 minutes of arc. When fitted with double lip seals, LBBR bearings enable these units to operate without relubrication, under normal operating conditions (see page 3).

For corrosive or wet environments, SKF recommends stainless steel shafting and either aluminium housings with stainless steel linear ball bearings e.g. LBBR 20-2LS/HV6 or aluminium housings fitted with plain bearings.

Shafting cut to length is available. For additional information, see the chapter "Precision shafts", page 52.

**LUHR/LUJR linear bearing units** consist of a housing of extruded aluminium and the compact LBBR linear ball bearing or the LPBR linear plain bearing of similar dimensions.

The LUHR design, for shaft diameters from 12 to 50 mm, is available fitted as standard with LBBR linear ball bearings with or without integrated seals or with LPBR linear plain bearings (designation LUHR ... PB).

For highly contaminated environments, extended LUJR linear bearing units are available. These incorporate LBBR linear ball bearings and two SP-type shaft seals. LUHR and LUJR linear bearing units cannot be relubricated.

**LTBR tandem linear bearing units** consist of a one-piece extruded aluminium housing and two LBBR linear ball bearings mounted one behind the other. These units are fitted with sealed bearings as standard and cannot be relubricated. They are particularly suitable for tables or slides of any width.

**LTDR duo linear bearing units** are characterised by an aluminium housing that contains two LBBR-2LS linear ball bearings in parallel. The space between the two bearings and the duo configuration permits easy fitting of a linear drive.

**LQBR quadro linear bearing units** – contain four (4) LBBR linear ball bearings within a sealed aluminium housing. The duo configuration and the space between the bearings permit the fitting of a linear drive. Duo and quadro linear bearing units based on LBBR linear ball bearings can be used to make compact, simple table configurations. For suitable shaft blocks (LEBS), see page 46.

# Linear ball bearings, ISO series 3

**LBC linear ball bearings**, with their high load carrying capacity, are available for shaft diameters from 5 to 80 mm. As with all SKF linear ball bearings, they are available with a choice of seals or shields. 5 and 8 mm LBC linear ball bearings that are full contained within their housings, are self-retaining so that no additional axial location is required under normal operating conditions.

All LBC linear ball bearings are generally designed for grease lubrication. Sizes from 12-80 mm feature cages with a through-bored radial hole to accommodate a grease fitting, which provides longitudinal and axial fixation. Grease may be applied directly to the shaft or bearing via this hole. For the relubrication of LBHT linear ball bearings the housing must be provided with a grease distribution channel in the bore or housing. The grease is then forced onto the raceway between the load carrying plates. Information on the location of these attachment holes and grease fittings is shown on pages 25 and 26.

## Stainless steel variant

LBC linear ball bearings are also available with stainless steel balls and raceways for wet or corrosive environments. The stainless steel variant is identified by adding a HV6 suffix to the designation e.g. LBCR 16-2LS/HV6. When used in combination with SKF stainless steel shafts, it is possible to create a guidance system made entirely of stainless steel.

**LBCR linear ball bearings** consist of a cage and raceway segments to guide the balls and either seals or shields. By virtue of their exceptionally long track length and the machined raceway oscillation, they are able to accommodate heavy loads.

LBCR linear ball bearings, with their optimised raceway segments and position for maximum load carrying capacity, can be mounted in closed as well as adjustable housings. When these bearings are mounted in a closed housing, the tolerance of the inscribed diameter of the ball set and hence the operating clearance is determined by the tolerance of the housing bore. When mounted in slotted housings the linear guides can be adjusted to provide either operating clearance or preload depending on the needs of the application. LBCR linear ball bearings must be located in the axial direction, for example via the grease fitting or a fixation pin.

**LBCD linear ball bearings** are a variant of the LBCR design. The primary feature of this bearing is its self-aligning capability that accommodates tilting of the whole bearing through an angle of  $\pm 30$  minutes of arc. This tilting feature compensates for misalignment, which may be caused by inaccuracies in fitting or manufacturing (housing bore diameter), or by significant bending of an unsupported shaft. The self-aligning feature cannot, however, compensate for two non-parallel shafts in an assembly. The cage, seals and shields have been optimized to accommodate the self-aligning feature so that the bearing and especially the shields or seals remain concentric with the shaft.

All other characteristics of the LBCR linear ball bearings are also valid for the self-aligning LBCD design. LBCD linear ball bearings must always be firmly fixed in the axial direction.

**LBCT and LBHT linear ball bearings** are used in applications where several shaft supports, or a continuous shaft support is needed to prevent shaft bending. Due to the open design of the LBCT bearing, one raceway segment is eliminated. However, this does not have a significant effect on its load carrying capacity. The raceway segments of the LBHT however, have been optimized so that it has the same number of raceway segments as a closed design bearing.

Both the LBCT and the LBHT are available for shaft diameters ranging from 20 to 50 mm. Unlike other open design linear ball bearings, these bearings feature a shoulder in the cage on each side of the opening which acts like a gap-type seal. Open designed LBCT/LBHT linear ball bearings must always be fixed to prevent axial and turning movements.

**LBCF linear ball bearings** are a self-aligning version of the LBCT design. These bearings are available in sizes ranging from 12 to 50 mm. LBCF linear ball bearings must always be fixed to prevent axial and turning movements.

## Linear plain bearings, ISO series 3

LPAR and LPAT linear plain bearings have the same external dimensions as LBC linear ball bearings. These bearings, which do not have seals or shields, are available in diameters ranging from 5 to 80 mm (LPAR) and from 12 to 80 mm (LPAT).

All variants, except for LPAR 5 and 8 can be relubricated. Bearings without a grease fitting should be held in place by a retaining ring (according to DIN 471) on either side of the bearing. Bearings with a grease fitting can be fixed via the grease fitting.

## Linear bearing units, ISO series 3

A comprehensive range of linear ball bearing and plain bearing units are available. In addition to the basic design housing containing a single bearing, flanged units are also available as/or tandem and quadro units.

Linear bearing units consist of a light-weight, cast aluminium housing that has been optimized to provide high strength and stiffness. Due to their light weight, acceleration and inertia forces are kept to a minimum. LUC linear bearing units are available for shaft diameters ranging from 8 to 80 mm.

**LUCD/LUCR linear bearing units** offer a simple means of creating an economical linear guidance system. LUCD linear bearing units (for shaft diameters ranging from 12 to 80 mm) are normally supplied with a self-aligning LBCD shielded linear ball bearing. LUCR linear bearing units (for shaft diameters ranging from 8 to 80 mm) are supplied with a rigid LBCR shielded linear ball bearing. A grease fitting serves to retain the bearing axially and prevent it from turning. These units are also

available fitted with LPAR linear plain bearings (designation LUCR ... PA) on request. Units fitted with an 8 mm diameter LPAR linear plain bearing cannot be relubricated. Therefore, these bearings should be axially located with retaining rings. The designation of these units is: LUCR/LUCR ... PA.

LQCR

LTCF

LUND

LUCF

LUCE

LVCR

**LUCE/LUCS linear bearing units** are similar in design to the LUCD/LUCR units but instead of a closed housing, these units have an open housing with an adjustment screw. These units are typically used for arrangements requiring zero clearance or preload.

LUCE/LUCD linear ball bearing units are supplied with self-aligning LBCD linear ball bearings. LUCS/LUCR linear ball bearing units are supplied with rigid LBCR linear ball bearings. These units are not available with linear plain bearings.

**LUCF/LUCT linear bearing units** are designed for applications where, because of heavy loads and/or long guidance lengths, the shaft must be supported either partially or along its entire length. For this reason, the housings as well as the bearings have an open design. In all other respects these units are similar to the closed LUCD/LUCR units. Open linear bearing units are available as standard with an LBCF self-aligning linear ball bearing or a rigid LBCT linear ball bearing.

For the 12 to 80 mm sizes, the bearing is retained axially by means of a grease fitting. Where high load carrying capacity or longer service life is required, LUCT units can also be supplied fitted with LBHT linear ball bearings in sizes ranging from 20 to 50 mm. (Designation: LUCT ... BH). These units can also be relubricated. Bearing units may also be supplied fitted with linear plain bearings (Designation LUCT ... PA).

**LUN linear bearing units** are supplied as standard with shielded or sealed self-aligning linear ball bearings. Three versions are available: closed (LUND), adjustable (LUNE) and open, adjustable (LUNF). They are suitable for shaft diameters from 12 to 50 mm.

In contrast to the LUC linear bearing unit described above, the ex-

truded aluminium housing envelops the linear ball bearing along its entire length. Two diagonally opposed attachment holes are provided on the underside of the housing to locate the bearing axially and to keep it from turning. These units can be relubricated.

**LVCR flanged linear bearing units** consist of a closed flanged cast iron housing fitted with a rigid LBCR linear ball bearing (12 to 80 mm). The bearing, sealed on both sides, is located axially by a dowel pin. The flange is machined on both faces to enable mounting on the front or rear in either direction. Flanged linear bearing units are not designed for relubrication.

**LTC tandem linear bearing units** consist of a solid extruded aluminium housing and two self-aligning linear ball bearings mounted one behind the other. A grease fitting is used to secure each bearing in position to prevent it from turning.

Tandem linear bearing units enable the construction of linear guidance systems such as tables of any required width. The housing can be attached to its supporting surface from below using socket head cap screws or from above via the two threaded holes in the housing. These tandem units are available in two versions: closed (LTCD) or open (LTCF). The linear ball bearings are supplied with one seal on the external end, as standard. Shaft diameters range from 12 to 50 mm.

**LQC quadro linear bearing units** consist of a one-piece aluminium housing with two bores arranged in parallel, each with two self-aligning linear ball bearings. The bearings are sealed on the external ends only. The bearings can be retained in position axially and also prevented from turning via the grease fitting. Except for

size 8 units, relubrication is possible. SKF quadro units are available in two versions: closed (LQCD) and open (LQCF).

Quadro units used in combination with LEAS tandem shaft blocks (closed design) or LRCB shaft supports (open design) makes it possible to create simple linear slides and tables. Details of tables are provided on pages 49 to 51 of this catalogue.

The LQC design is available for shaft sizes from 8 to 50 mm. An exception is the size 8 unit that is fitted with an LBCR 8 A-LS non self-aligning linear ball bearing (full designation LQCR 8 A-2LS). LQCF units are suitable for shaft diameters from 12 to 50 mm.

All quadro units can be attached to their support surface either with socket head cap screws inserted from below or via the threaded holes in the housing.

#### **Note**

All linear ball bearing units (12 to 50 mm) can be fitted with non-self-aligning linear ball bearings on request.

<sup>1)</sup> Smallest sector width at diameter  $F_w$ .

<sup>2)</sup> For 4 cylindrical screws with internal hexagon to DIN 912 / ISO 4762.

# Shaft carriers / shaft blocks

Among shaft carriers, a distinction is made between shaft blocks and shaft supports. Shaft blocks support the shaft only at its ends; shaft supports typically run the entire length of the shaft and therefore require the use of open linear bearing units.

**LSCS shaft blocks** are made of cast aluminium and designed to grip the end of the shaft. These blocks are supplied as standard with two holes drilled in the base for attachment. LSCS shaft blocks are suitable for shaft diameters ranging from 8 to 80 mm.

**LSNS and LSHS shaft blocks** are made of extruded aluminium. They can be attached by through bolts or they can be bolted, via threaded holes, directly to the support surface.

LSNS and LSHS shaft blocks are available for shaft diameters ranging from 12 to 50 mm.

### LEBS/LEAS tandem shaft blocks

To match the duo and quadro linear bearing units with ISO series 1 linear ball bearings (LBBR), LEBS tandem shaft blocks are available in the "A" design, where the shaft block is fixed and the linear bearing moves axially. LEBS shaft blocks are available for shaft diameters ranging from 12 to 50 mm. For units with ISO series 3 linear ball bearings (LBC/LBHT) LEAS tandem shaft blocks are available in both the "A" and "B" design. The "B" design enables axial movement of the shafts through a fixed linear bearing unit. LEAS shaft blocks are available for shaft diameters ranging from 8 to 50 mm.

### LRCB/LRCC shaft supports

For heavily loaded linear bearing units and/or long track lengths, SKF recommends the use of shaft supports to eliminate shaft bending. For these applications, continuous or at least partial support of the shaft is necessary. SKF offers shaft supports for shaft diameters ranging from 12 to 80 mm. There are two types of shaft support: the LRCB with predrilled holes and the LRCC without holes.

Note: Shaft supports require the use of open design linear bearing units.

## Quadro linear tables, non-driven

The closed LZBU quadro linear table consists of a closed quadro linear bearing unit, two tandem shaft blocks and two shafts of the required length. The bearing unit is fitted with four LBCD-LS self-aligning linear ball bearings, each sealed at one end. The LZBU-“A” design enables axial movement of the linear bearing unit, i.e. the shafts are fixed to the machine bed via LEAS-“A” shaft blocks. The LZBU-“B” design is provided with LEAS-“B” shaft blocks. This combination enables the shafts to travel with the shaft blocks in applications where the linear bearing unit is fixed.

LZBU quadro linear tables can be supplied in sizes ranging from 8 to 50 mm. Size 8 tables are not self-aligning

and are not designed for relubrication. The description of the closed quadro-linear table also applies to the combination of series 1 LQBR ... 2LS quadro linear bearing units with twin LEBS tandem shaft blocks and shafts (on special request only). Shaft diameters range from 12 to 50 mm.

The open LZAU quadro linear table comprises the open quadro-linear unit and two high precision shafts with shaft supports. The bearing unit is fitted with four LBCF-“A-LS” self-aligning linear ball bearings, each sealed on one end. The length of these tables is dictated by the distance between centres of the attachment

holes in the LRCB shaft supports. The total length should always be a multiple of this distance. LZAU are available in sizes ranging from 12 to 50 mm.

50	—	600	900	1 200	1 500	1 800	2 100	2 400	2 700	3 000

<sup>1)</sup> The designation for an LZAU quadro-linear table with a shaft length of, for instance, 600 mm LZAU ... -2LS x 600. Delivered with shafts and shaft supports ready assembled.

<sup>2)</sup> Suitable Screws with internal hexagon according to DIN 912 / ISO 4762.

<sup>3)</sup> The separation is always arranged symmetrically to half the table length.

<sup>4)</sup> Valid only for even loading of all four LBC ... A linear ball bearings.

# Precision shafts

SKF precision shafts can be supplied either as solid or hollow shafts. Solid shafts are available in all dimensions required to fit SKF linear ball bearings; hollow shafts have a minimum outer diameter of 16 mm. They are induction hardened and ground (see table on next page). SKF shafts have exceptionally high dimensional stability and are designed for long service life.

The shaft ends of normal shaft production may deviate in hardness and dimension accuracy. For special applications, solid shafts of stainless steel or hard chromium plated shafts with a chromium coating of approximately 10 µm thickness can be supplied. Note that the surface of a

stainless steel shaft is not as hard as the surface of a shaft made of high-grade steel. The case depth may also be greater than indicated in the table and this may have an influence on the machinability of the shafts. Because of the benefits they offer, SKF precision shafts are not only used together with SKF linear ball bearings for linear guides, but are also used for other applications like axles or column sleeves.

## Materials

SKF precision shafts are made from non-alloyed high-grade steels Cf53 (Material No.1.1213), Ck53 (Material No.1.1210), C60 (Material No.1.0601) and 100Cr6 (Material No.1.3505). The surface hardness is

between 60 and 64 HRC. Solid stainless steel shafts are made from X90CrMoV18 (Material No.1.4112) or X46Cr13 (Material No.1.4034). In this case the surface hardness lies between 52 and 56 HRC. Shafts made from other materials can be supplied to special order.

## Surface finish

All SKF precision steel shafts have a surface roughness of max.  $R_a$  0,3 µm.

#### Case hardening of SKF shafts

Shaft diameter		Hardness depth min
over	incl	
mm		mm
—	10	0,5
10	18	0,8
18	30	1,2
30	50	1,5
50	80	2,2
80	100	3,0

#### Tolerances

SKF precision steel shafts are machined to h6 or h7 tolerances. The accuracy of dimensions and form of these shafts can be found in the table on page 56. There may be slight deviations from the values provided in the tables for sections of the shaft that have been annealed. SKF precision steel shafts with diameters machined to tolerance h9 can be supplied to special order. Shafts cut to special lengths have a length tolerance to ISO 2768 medium class. The relevant values are provided in the adjacent table.

#### Shafts with radial holes

For linear guides requiring support, shafts with threaded radial holes are needed. These can be supplied by SKF. The radial holes may be either positioned to fit SKF shaft supports or as specified on the customer's drawings. However, SKF recommends using the guideline values provided in the adjacent table for thread size and depth. SKF shafts with radial holes are not annealed at the drilling position; the thread is cut in the case hardened and ground shaft to avoid any changes in hardness or dimensional accuracy.

#### Composite shafts

Composite shafts can be supplied to customer drawings, either with screwed joints or with "plug and socket" joints, depending on the application. Accurately centred trunnions and sockets provide smooth transitions at the butt joint. To enable correct assembly, the relative positions of the shaft sections and shaft ends are marked. Composite shafts should be fastened to a support at the butt joints, particularly when "plug and socket" joints are used. When drilling radial holes for the supports, drill as close as possible to the joint.

Note: the length of the shaft and the positioning of the supports should be determined so that any bending of the shaft will not cause a gap to form at the joint.

#### Length tolerances for shafts to ISO 2768 medium class

Nominal length		Deviation
over	incl	
mm		mm
—	120	± 0,3
120	400	± 0,5
400	1 000	± 0,8
1 000	2 000	± 1,2
2 000	4 000	± 2
4 000	8 000	± 3

#### Corrosion protection, packing

SKF precision steel shafts are treated with a rust inhibiting preservative that must be removed before the shafts are installed. Depending on size and quantity, they are supplied in cardboard or wooden boxes that offer maximum protection during transport.

#### Standard length of the shafts<sup>1)</sup>

SKF precision steel shafts are available in following length

## Attention:

d<sub>1</sub> can deviate from the value quoted. Please enquire if necessary.

Different shaft diameters and types on request.

The static load capacity has to be decreased by 8 % and the dynamic load capacity by 18 % when using the non corrosi-on types (HV6) in conjunction with precision steel shafts made of stainless steel.

<sup>1)</sup> Shafts cut to special length with chamfered ends. The length tolerance of these shafts corresponds to LJM 20x1500 ESSC2 medium class. The designation for a shaft with 20 mm diameter cut to a length of 1,5 m is, for example, LJM 20x1500 ESSC2.

# Precision shafts of high-grade steel
